Experiment 5: Design a wireframe for a mobile application that incorporates localization features using Figma

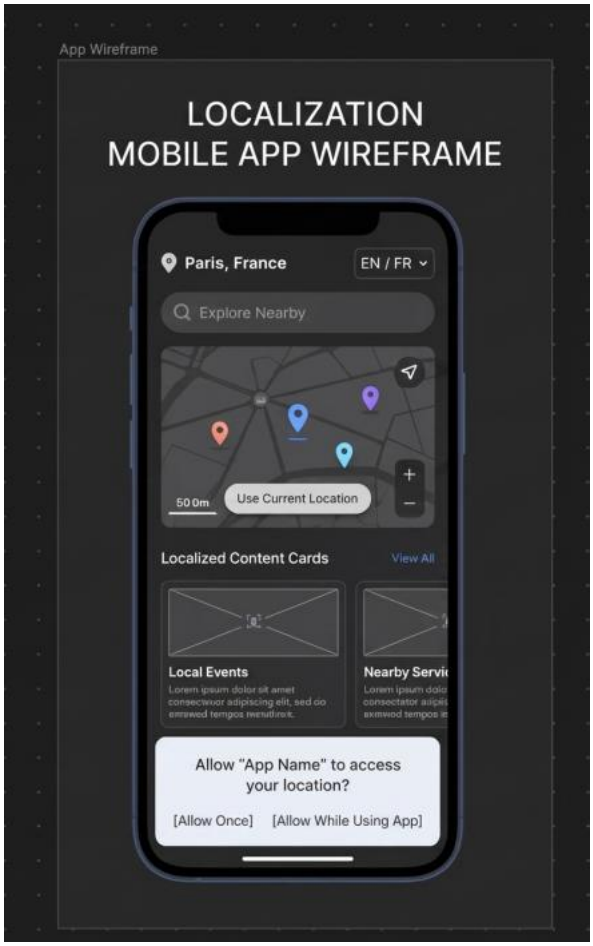

Aim

To construct a minimalistic mobile application wireframe in Figma demonstrating integrated localization, language switching, and region-specific features.

Procedure (10 Steps)

1. Create a new frame named "App Wireframe" sized to standard mobile device dimensions (e.g., iPhone frame).
2. Add a mobile device mockup bezel with a rounded outer border and top speaker notch.
3. Place a top header bar containing a detected location label (e.g., "Paris, France").
4. Design a language selector dropdown toggle (e.g., "EN / FR") in the top-right corner.
5. Insert a search bar component labeled "Explore Nearby" with a search icon.
6. Draw a map viewport container containing custom pin markers and a "Use Current Location" button.
7. Add zoom controls (+ / -) and a distance scale marker (e.g., "500m") over the map.
8. Create a section titled "Localized Content Cards" with horizontal placeholders for local events and services.
9. Overlay a system permission dialog asking: *"Allow 'App Name' to access your location?"* with prompt action buttons.
10. Align all elements using Figma's Auto-Layout, adjust typography hierarchy, and organize components in the layers panel.

Design:

Result

A functional and minimalistic mobile wireframe highlighting multi-language support, GPS-based location detection, and localized content delivery was successfully modeled in Figma.
