Experiment 7: Cellular System Performance Dashboard Prototype Using Figma

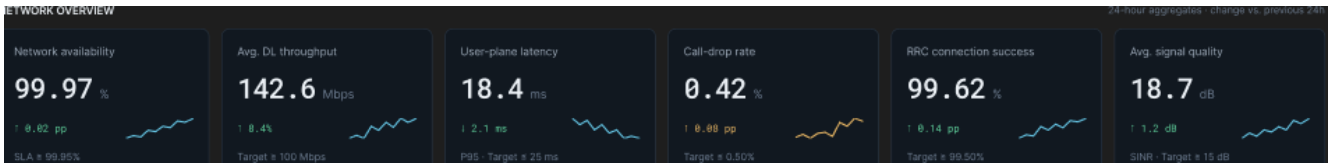

Aim

To design and develop an interactive dashboard prototype using Figma to display and monitor the performance criteria of a cellular communication system, such as signal strength, network coverage, data speed, call quality, latency, and network availability.

Procedure

1. **Open Figma:** Open the Figma website (www.figma.com) and log in to your account.
2. **Create a New File:** Click on the New Design File option to create a new dashboard design.
3. **Set Up the Frame:** Select the Frame tool (F) and choose a desktop screen size (1440 × 900 pixels).
4. **Create the Dashboard Layout:** Design the main dashboard structure with a header, sidebar, navigation menu, and main content area.
5. **Add Performance Cards:** Create cards to display important cellular network performance criteria such as: Signal Strength (dBm), Download Speed (Mbps), Upload Speed (Mbps), Latency (ms).
6. **Add Network Performance Charts:** Use Figma shapes and plugins to create graphs showing network traffic, data usage, and signal quality.
7. **Design Network Coverage Section:** Add a network coverage map to represent cellular coverage areas and signal availability.
8. **Apply Colors and Typography:** Use suitable colors, icons, fonts, and labels to make the dashboard attractive and easy to understand.
9. **Create Interactive Prototype:** Connect buttons, navigation menus, and dashboard pages using the Prototype tab in Figma.
10. **Preview and Save:** Click the Present button to preview the dashboard, check its functionality, make necessary corrections, and save the final design.

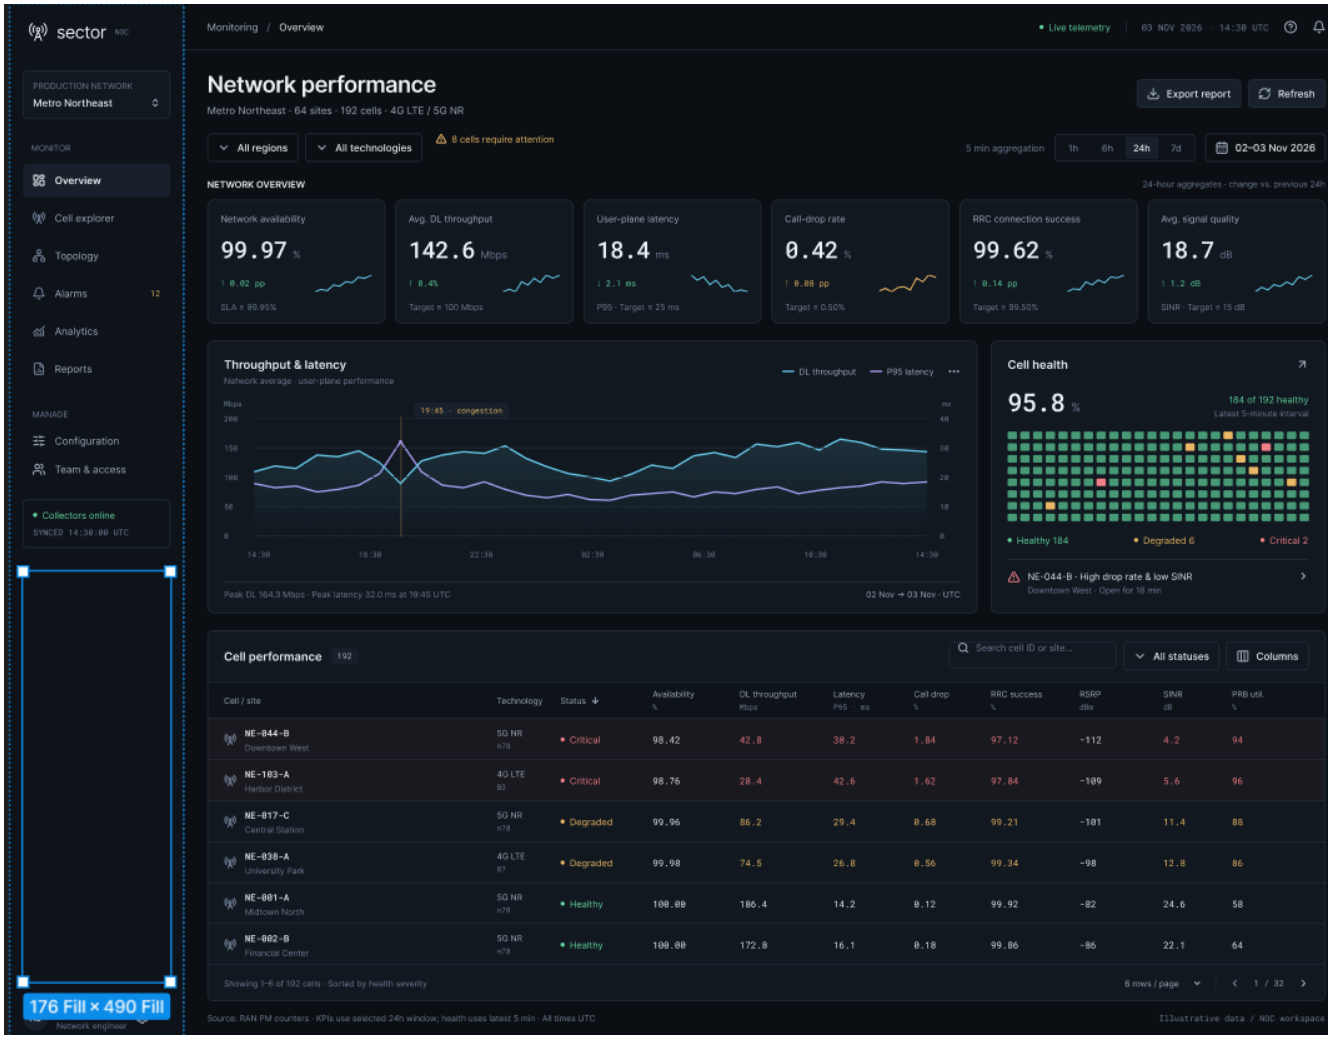

Design

Prototype

Result

The cellular system performance dashboard prototype was successfully designed in Figma. It presents key network performance measures, including signal strength, coverage, data speed, call quality, latency, and availability, in a clear dashboard layout. The interactive prototype demonstrates how users can navigate and monitor cellular network performance.
